

The shaping of social perception by stimulus and knowledge cues to human animacy

Supplementary Figure.

Interactions between stimulus and knowledge cues to human animacy

Panel A illustrates regions along midline cingulate cortex that emerged from the contrast comparing congruent form and belief pairings to incongruent pairings (see Material and methods in the main text for full explanation of pairings). Panel B illustrates activity within the cerebellum and inferior frontal gyrus that emerged from the interaction comparing incongruent to congruent pairings. Full details of these findings are presented in Table 1 of the main text.
